

I learn from this task :

- Getting Data from Users and Comprehending Variable Types: I have discovered how to collect data from users and store it in many forms of boxes, such as text or numbers. I understood what kind of data I was receiving.
- Working with Functions and For Loops:
I learned functions, which helped me organize my code and do the same thing over and over again without typing it out each time.
For loops were like little helpers that let me do things like count or repeat tasks without having to do them manually each time .
- I learned how to use Python's built-in methods, including `min()` and `max()`, to determine the smallest and largest values in a set of data through the challenges. and these functions saved me time and effort
